

Task 4: Implement a Language Toggle Button in a Vue.js App

Use your previous task on vue js to make a feature allowing users to toggle between Arabic and English. This will involve adding a language switch button to dynamically change the entire website's language content. The application should utilize a translation library you can search to manage the translations. Translation files for both languages (Arabic and English) should be used, and the app should correctly translate all UI elements upon switching the language. Ensure the following:

Key Requirements:

1. **Language Toggle:** Implement a button or dropdown to toggle between Arabic and English.
2. **Translation Management:** Load and apply translations from JSON or other translation files.
3. **RTL (Right-to-Left) Support:** Ensure the proper RTL layout and formatting when Arabic is selected.
4. **Consistent Design:** Follow the required UI/UX design guidelines, ensuring the app maintains consistent styling, spacing, and font usage across both languages.
5. **UI Layout Adjustments:** Ensure that all UI components (e.g., buttons, forms, text fields) adjust fluidly between RTL and LTR layouts, preserving the design's integrity in both languages.
6. **Responsiveness:** Ensure the design remains fully responsive across different devices and screen sizes when switching between languages.
7. **Vue.js Best Practices:** Use Vue.js best practices for managing the state and updating the UI based on the selected language.
8. **Thorough Testing:** Perform extensive testing to ensure all sections of the app are properly translated and the UI behaves correctly when toggling between Arabic and English.

Important requirement:

- You should strictly adhere to the required UI design guidelines for a polished and professional user experience.
